Linear Programming

General form

A linear program (LP) is an optimization problem of the form:

minimize
$$\mathbf{f}^{\top}\mathbf{x}$$
,
subject to
$$\begin{cases} \mathbf{A}\mathbf{x} \leq \mathbf{b}, \\ \mathbf{C}\mathbf{x} = \mathbf{d}. \end{cases}$$
 (1)

It is one of the older and widely used classes of convex optimization problems.

Note that the solution of such problem will always lie on the boundary of its domain.

LINEAR PROGRAMMING

LP with no solution - examples

Here are some examples of LP which have no solutions:

$$\underset{\mathbf{x}}{\text{minimize}} \quad \begin{bmatrix} 1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \tag{2}$$

This one is has no boundaries at all, hence no solution. Next one has boundaries, but they do not restrict motion along the descent direction for the cost function.

minimize
$$\begin{bmatrix} 1 & 1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$
,
subject to $\begin{bmatrix} 1 & 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \le 1$ (3)

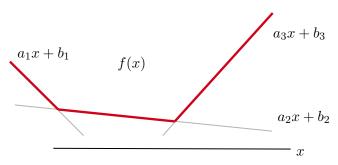

CONVEX PIECE-WISE LINEAR FUNCTIONS

Problem statement

Convex piece-wise linear functions have the form:

$$f(\mathbf{x}) = \max(\mathbf{a}_i^{\mathsf{T}} \mathbf{x} + b_i) \tag{4}$$

Figure below shows geometric interpretation of such function for a one-dimensional case.

CONVEX PIECE-WISE LINEAR FUNCTIONS Solution as LP

We can formulate a minimization problem using convex piece-wise linear functions:

$$\underset{\mathbf{x}}{\text{minimize}} \quad \max(\mathbf{a}_i^{\top} \mathbf{x} + b_i) \tag{5}$$

Which can be equivalently transformed into the following LP:

minimize
$$t$$
subject to $\mathbf{a}_i^{\top} \mathbf{x} + b_i \leq t$ (6)

We can observe that optimal (minimal) t will have to lie on one of the linear functions $\mathbf{a}_i^{\mathsf{T}}\mathbf{x} + b_i$, i.e. on the original piece-wise linear function $f(\mathbf{x})$. And optimal value on t corresponds to the smallest value of the original function $f(\mathbf{x})$.

SUM OF PIECE-WISE LINEAR FUNCTIONS Solution as LP

Sum of convex piece-wise linear functions have the form:

$$f(\mathbf{x}) + g(\mathbf{x}) = \max(\mathbf{a}_i^{\mathsf{T}} \mathbf{x} + b_i) + \max(\mathbf{c}_i^{\mathsf{T}} \mathbf{x} + d_i)$$
 (7)

Their representation as LP is:

minimize
$$t_1 + t_2$$

subject to
$$\begin{cases} \mathbf{a}_i^\top \mathbf{x} + b_i \le t_1 \\ \mathbf{c}_i^\top \mathbf{x} + d_i \le t_2 \end{cases}$$
(8)

CONVEX PIECE-WISE LINEAR FUNCTIONS Code

```
o func = @(t) t^2:
  derivative\_func = @(t) 2*t;
  approx_points = [-1, -0.3, 0, 0.3, 1];
4|n = length (approx_points);
  a = zeros(n, 1);
6 \mid b = zeros(n, 1);
s \mid for i = 1:n
      t = approx_points(i);
  a(i) = derivative\_func(t);
       b(i) = func(t) - a(i)*t ;
12 end
|14| f = [1; 0];
  \lim_{A} A = [-\operatorname{ones}(n, 1), a];
16 | \lim_{b} = -b;
  x = linprog(f, lin_A, lin_b, [], []);
```

ZERO-INFINITY FUNCTION

Consider a function that returns 0 for negative inputs, and infinity for positive ones:

$$f(x) = \begin{cases} 0 & x \le 0 \\ \infty & x > 0 \end{cases} \tag{9}$$

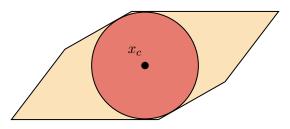

We can equivalently replace it with the following piece-wise linear function:

$$f(x) = \max_{\lambda \ge 0} \lambda x \tag{10}$$

CHEBYSHEV CENTER OF A POLYHEDRON

Problem statement

Chebyshev center of a polyhedron is the center of the largest ball inscribed in a polyhedron:

Equation describing this ball can be written as:

$$\mathcal{B} = \{\mathbf{x}_c + \mathbf{u} : ||\mathbf{u}||_2 \le r\}$$
 (11)

where r is the radius of the ball and \mathbf{x}_c is its center.

CHEBYSHEV CENTER OF A POLYHEDRON

Max over the dot product

Before we move towards solving the problem, let us consider the following maximization:

$$\sup\{\mathbf{a}^{\top}\mathbf{u}: ||\mathbf{u}||_2 \le r\} \tag{12}$$

We can re-write the expression:

$$\sup\{\mathbf{a}^{\top}\mathbf{u}: ||\mathbf{u}||_{2} \le r\} = \sup\{||\mathbf{a}|| \cdot ||\mathbf{u}||\cos(\varphi): ||\mathbf{u}||_{2} \le r\}$$
(13)

where φ is the angle between **a** and **u**. Since **a** is constant, $\max(||\mathbf{u}||) = r$, and $\max(\cos(\varphi)) = 1$, we get:

$$\sup\{\mathbf{a}^{\top}\mathbf{u}: ||\mathbf{u}||_2 \le r\} = ||\mathbf{a}||r \tag{14}$$

CHEBYSHEV CENTER OF A POLYHEDRON Solution as LP, part one

For the ball \mathcal{B} to be inscribed in a polygon $\mathcal{P} = \{\mathbf{x} : \mathbf{A}\mathbf{x} \leq \mathbf{b}\}$, the following should hold:

$$\sup\{\mathbf{a}_i^{\top}(\mathbf{x}_c + \mathbf{u}) : ||\mathbf{u}||_2 \le r\} \le b_i$$
 (15)

Note that the largest value of $\mathbf{a}_i^{\top}\mathbf{u}$ under condition $||\mathbf{u}||_2 \leq r$ is $r||\mathbf{a}_i||$: it can indeed achieve this value if \mathbf{a}_i and \mathbf{u} are co-directional, but a larger one is not possible. Therefore:

$$\sup\{\mathbf{a}_i^{\top}(\mathbf{x}_c + \mathbf{u}) : ||\mathbf{u}||_2 \le r\} = \mathbf{a}_i^{\top}\mathbf{x}_c + r||\mathbf{a}_i|| \le b_i$$
 (16)

CHEBYSHEV CENTER OF A POLYHEDRON Solution as LP, part two

Finally, we can write down the solution of the problem as a linear optimization:

maximize
$$r$$
 r, \mathbf{x}_c
subject to $\mathbf{a}_i^{\top} \mathbf{x}_c + r||\mathbf{a}_i|| \leq b_i$ (17)

CHEBYSHEV CENTER OF A POLYHEDRON Code

Below we can see MATLAB code for solving the problem:

```
V = randn(10, 2);
_{2}|_{k} = convhull(V);
 P = V(k, :);
  [domain_A, domain_b] = vert2con(P);
6 norm_A = vecnorm (domain_A');
| \mathbf{s} | \mathbf{f} = [-1; 0; 0];
 A = [reshape(norm_A, [], 1), domain_A];
b = domain_b;
|x| = \lim_{h \to 0} (f, A, b, [], []);
14 center = [x(2), x(3)];
  r = x(1);
```

LINEAR-FRACTIONAL PROGRAMMING

The following is the Linear-Fractional Programming problem:

maximize
$$\frac{\mathbf{c}^{\top}\mathbf{x} + d}{\mathbf{e}^{\top}\mathbf{x} + f}$$
subject to
$$\begin{cases} \mathbf{A}\mathbf{x} \leq \mathbf{b} \\ \mathbf{A}_{e}\mathbf{x} = \mathbf{b}_{e} \end{cases}$$
 (18)

This doesn't look like an LP, but let us see if we can try to bring this problem into this form.

LINEAR-FRACTIONAL PROGRAMMING

The following is the Linear-Fractional Programming problem in LP form:

maximize
$$\mathbf{c}^{\top}\mathbf{y} + zd$$
subject to
$$\begin{cases}
\mathbf{A}\mathbf{y} \leq z\mathbf{b} \\
\mathbf{A}_{e}\mathbf{y} = z\mathbf{b}_{e} \\
\mathbf{e}^{\top}\mathbf{y} + zf = 1 \\
z \geq 0
\end{cases}$$
(19)

Here the variables \mathbf{y} and z are related to \mathbf{x} as follows.

$$\mathbf{y} = \frac{\mathbf{x}}{\mathbf{e}^{\top} \mathbf{x} + f} \tag{20}$$

$$z = \frac{1}{\mathbf{e}^{\top} \mathbf{x} + f} \tag{21}$$

LINEAR-FRACTIONAL PROGRAMMING

We assumed that the domain of the previous problem is limited to $\mathbf{e}^{\top}\mathbf{x} + f \geq 0$. With that we have:

$$\mathbf{c}^{\top}\mathbf{y} + zd = \mathbf{c}^{\top}\frac{\mathbf{x}}{\mathbf{e}^{\top}\mathbf{x} + f} + \frac{1}{\mathbf{e}^{\top}\mathbf{x} + f}d = \frac{\mathbf{c}^{\top}\mathbf{x} + d}{\mathbf{e}^{\top}\mathbf{x} + f}$$
(22)

$$\mathbf{A}\mathbf{y} \le z\mathbf{b} \implies \mathbf{A}\frac{\mathbf{x}}{\mathbf{e}^{\top}\mathbf{x} + f} \le \frac{1}{\mathbf{e}^{\top}\mathbf{x} + f}\mathbf{b} \implies \mathbf{A}\mathbf{x} \le \mathbf{b}$$
 (23)

Homework

Implement linear approximation of a convex function and solve it as LP
